**Immersion in video games**

Immersion in games raises interesting questions both for social scientists and for philosophers. While the gaming community (industry, reviewers and bloggers) tend to praise the immersive potential as one of the major qualities of a successful game, at the same time deploring the immersion-breaking elements, scientific literature often points to its darker side. For example, immersion has been linked with addiction or escapism. For the moral philosophers, the central issue is often that of the constitutive elements of an authentic and valuable pleasure, calling into focus various problems associated with moral hedonism. The lecture reviews these issues, arguing that, while some of these concerns are not unfounded, games should still not be identified as the main culprit in the story.
